

GUEST INTELLIGENCE · HOTEL OPERATIONS

9 THINGS EVERY OPERATOR SHOULD KNOW.

What the data says about guest spend, on-property experience, and why the gap between check-in and checkout is the most undermonetized window in hospitality.

28%

Average share of hotel guests who use on-site dining without a prompt

10 MIN

The post-check-in window where a personalized offer has the highest conversion rate

45%

Potential ancillary revenue recovery when guests receive contextual touchpoints during their stay

WHY THIS MATTERS

Most hotels are solving the wrong problem.

The instinct is to optimize for occupancy. The data says the real margin lives in what guests spend after they drop their bags. Those are two different revenue models — and only one scales without more rooms.

Occupancy isn't the finish line

Only 28% of guests use on-site dining without a prompt. The room is booked — the ancillary revenue window is wide open and mostly ignored.

Margin lives on property

Better service flow across dining, amenities, and room service moves total revenue without adding a single new booking. Most GMs don't model that number daily.

Direct rebook beats the OTA

Guests who feel unrecognized during a stay go back to the OTA. Guests who feel known rebook direct — and spend more on the return visit.

Contextual touchpoints compound

Dining reminders, amenity offers, and checkout options each move the needle independently. Properties that connect all three recover up to 45% of missed ancillary revenue.

THE CORE INSIGHT

The problem isn't the hotel. It's that the guest never felt known. That's a solvable problem that doesn't require a renovation.

The Revenue Case Points 1 – 3

1 AFTER CHECK-IN

Hotels optimize for occupancy. The real margin lives in what guests spend after they drop their bags.

The room rate is the entry point — dining, amenities, and room service are where profit actually compounds during the stay.

2 +15% REVENUE

Better service flow across dining, amenities, and room service moves total revenue without adding a single new booking.

That's not from more heads in beds. It's from the same guests, spending more on property because the offers arrived at the right moment.

3 +7.5% REVENUE

Guests who receive a personalized on-property offer spend measurably more than those who don't — same room, same stay.

The room didn't change. The relevance did. One contextual touchpoint shifts both spend and satisfaction — without a rate increase.

3

The Return Visit Risk Points 4 – 5

POINT 4 · THE DIRECT REBOOK RISK

Guests who feel unrecognized during a stay are significantly less likely to rebook directly — they go back to the OTA.

Recognition isn't a loyalty program perk — it's a distribution strategy. When guests feel unknown, the next booking happens on a platform that takes your margin.

POINT 5 · KNOWN VS. ANONYMOUS

The problem isn't the hotel. It's that the guest never felt known. That's a solvable problem that doesn't require a renovation.

Guests don't need a remodel. They need one moment where the property anticipated what they wanted. That moment is operational — not capital-intensive.

4

The Communication Lever

Points 6 – 7 · The fix that costs nothing extra

POINT 6 · THE RIGHT OFFER. THE RIGHT MOMENT.

A single contextual touchpoint — a dining reminder, a pool cabana offer, a late checkout option — shifts both spend and satisfaction scores.

The stay didn't change. The timing did. One relevant offer proves ancillary revenue is a guest experience problem — not a marketing problem.

POINT 7 · THE CONNECTED PROPERTY

Properties that connect dining, room service, amenities, and checkout into one guest intelligence layer consistently outperform siloed operations.

Each department works on its own. But the gap between a property that fixes one touchpoint and one that connects the full stay is where ancillary revenue separates.

The Speed Standard Points 8 – 9 · What good actually looks like**POINT 8 · CHECK-IN SPEED**

Check-in speed has a direct, measurable impact on how much a guest spends during their stay. The faster the friction is removed, the sooner revenue begins.

Speed isn't about rushing the guest. It's about removing friction from the parts of the experience that don't need to be slow — so ancillary offers land while guests are still deciding.

POINT 9 · THE FIRST HOUR

Guests who check in within 5 minutes and receive one personalized touchpoint within the first hour report higher satisfaction and higher on-property spend.

Ten minutes post-check-in is the conversion window. Five minutes to get them in the room. One touchpoint in the first hour. That's the operating standard the data supports.

Source: Hotel check-in and first-hour engagement research

WHAT THIS MEANS FOR YOUR PROPERTY

Five minutes to check in. Ten minutes to land the first offer. Forty-five percent of missed ancillary revenue recoverable with contextual touchpoints. Those aren't abstract research numbers. They're the operating targets every hotel team should be working toward.

WHAT TO DO NEXT

READY TO FIX THE FRICTION?

HeyYou helps hotel operators see their guests before they arrive, so the on-property experience starts before check-in.

OPTION 1**BOOK A DEMO**

See how HeyYou works inside a real hotel environment. 30 minutes. No pitch deck — just the product doing what it does.

seamlessly.us/demo

OPTION 2**BRING US TO YOUR
TEAM**

We come to your property, walk your floors, and present these findings to your leadership team in person. Built around your specific operation.

seamlessly.us/present

Not ready yet? That's fine. Keep this as a reference. Share it with your GM or F&B team.

Your guests are already in the building. The question is whether they feel it.
